

I joined National Geographic's Genographic Project to map the human journey and its scientists ran a cutting-edge test of my DNA.

Here is what I learned about my ancient ancestry:

As humans first migrating out of Africa more than 60,000 years ago, Neanderthals were still living in Eurasia. It seems our ancestors hit it off, leaving a small trace of these ancient relatives in my DNA.

MY MAP

THE HANSEN LINE: MY MATERNAL LINEAGE BEGAN ABOUT 150,000 YEARS AGO.

My maternal ancestors left Africa and settled around southeastern Europe. They then expanded north into the rest of Europe. They survived by hunting and finding wild food sources. In Europe, they met with those who were already there and formed new cultures that are reflected in the archaeological record. Thus, my cousins played an important role in the history of Europe.

My maternal branch is J1c2b5

THE PETELLE LINE: MY PATERNAL LINEAGE BEGAN AT LEAST 180,000 YEARS AGO.

My paternal ancestors left Africa and settled around southeastern Europe. They then expanded north into the rest of Europe. They survived by hunting and finding wild food sources. In Europe, they met with those who were already there and formed new cultures that are reflected in the archaeological record. Thus, my cousins played an important role in the history of Europe.

My paternal branch is I-P215

That's my story. What's your story?

Join this real-time scientific project now and help us tell the human story, while discovering more about yourself than you ever thought possible.
